> build --in-public

I built my own posting robot with AI._

the new way to build

one person + AI + free tools

[fact]

the problem: posting daily while busy.

3 posts a day, 2 platforms
  └── every single day
      └── not while running companies

[fact]

step 1: describe it in plain words.

"post my content at 8am, 1pm and 7pm. let me review it the night before. let me cancel any post."

that was the whole spec

[fact]

step 2: free building blocks.

github	stores posts, runs them on a schedule
linkedin	official posting api
instagram	official posting api
claude	wrote and fixed the code

[fact]

step 3: ship, then fix what breaks.

day 2: github's timer ran hours late.

└── fix: a backup trigger

real users find real bugs

[thesis]

the blueprint has changed.

before: a team, months, money

now: one person, days,
mostly free tools

the skill is knowing what
to build and steering AI
