> build --in-public klaerus

# I built a trading app that shows you the answer first._

payout before you trade

exit price on the chart

stake = maximum loss

[fact]

# the problem with leverage.

```
pick 20× because everyone does
  └── price moves against you
        └── position gone
              └── lost more than you meant to
```

[fact]

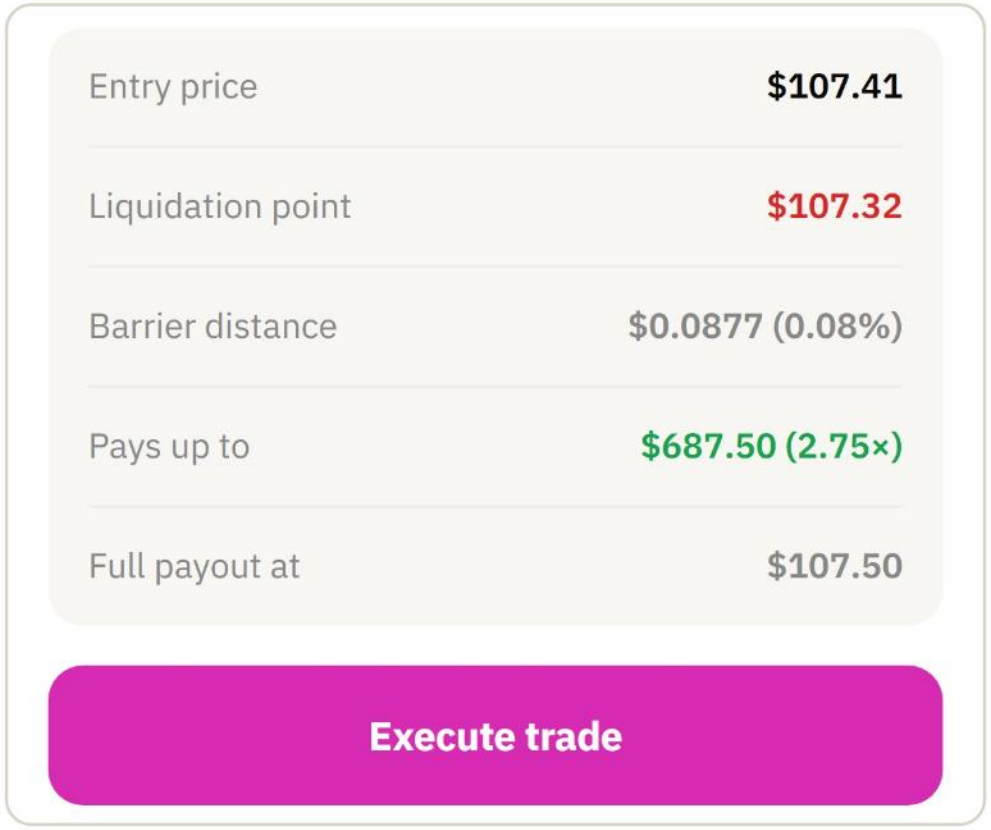

# two prices, drawn before you commit.

# red: where the trade ends.
# green: where the full payout lands.

[fact]

# the ticket tells you the outcome range.

[fact]

# your stake is the most you can lose.

no borrowing

no margin call

no negative balance

cut profit or stop out mid-trade

at a quoted price

not a setting. a fact.

[thesis]

# it publishes its own house edge.

every payout sits below fair value.
that is the business model.

the app lists its margin per
contract, generated from the
live settings.

status: paper-trading demo

play money, no real deposits
