Roland, I code with AI in Cursor. Someone said an extension there **had a backdoor?** 😳

True. On 29 Oct, fake versions of the "Claude Code" extension sat in Cursor's marketplace for about 11 hours.

Versions 2.1.312 and 2.1.313. **Not made by Anthropic.**

What it did 🚪

Sent the attacker your username, computer name, Git email and IP address.

Then tried to add a hidden SSH key: **a secret door into your computer.**

I'll just uninstall it then 👍🏾

Not enough. It dropped its own scripts that keep retrying the connection every 60 seconds.

Cursor says **uninstalling may not remove it.**

How to check in 1 minute ✅

Look in your SSH authorized_keys file for a key named **svc-telemetry**.

Cursor's notice has a one-line check for Mac and Windows. No key = not affected.

Found it? 🚨

Run Cursor's clean-up script from the notice. If unsure, rebuild the machine.

From a clean device, **change your passwords, tokens and API keys.**

The lesson for every AI tool 🧠

A famous name in a marketplace is not proof it's real.

Every extension can run code on your machine. **Install fewer. Check the publisher.**
